

04/08/08 TEST of ELECTRONICS:

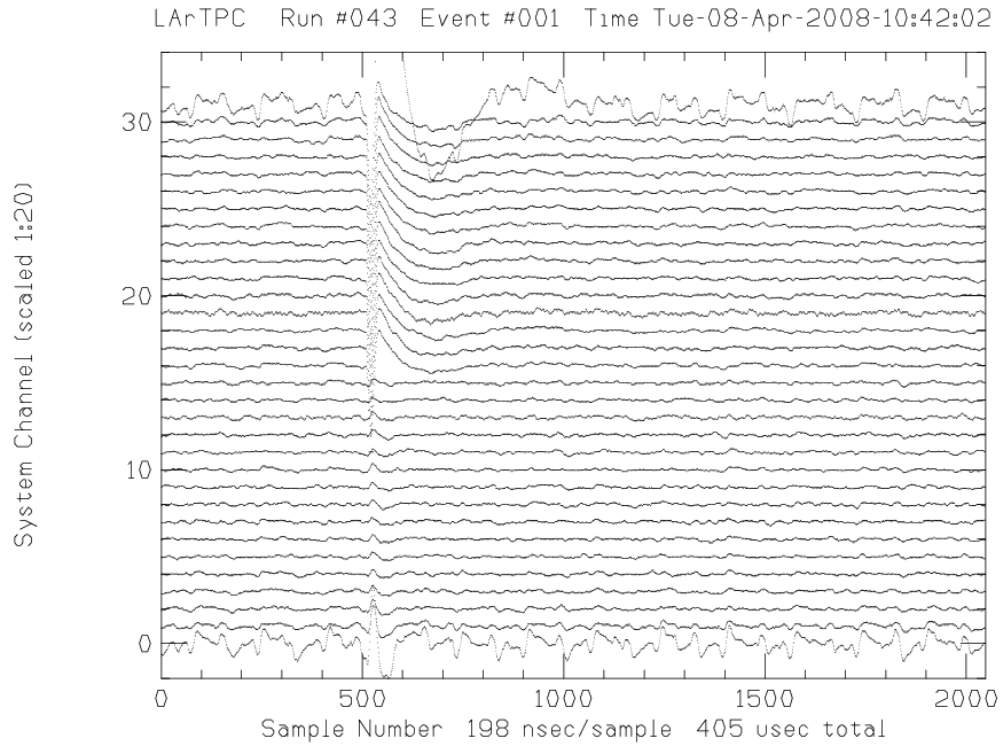

S. Pordes/C. Bromberg.

Conclusion and picture of pulses at the end.

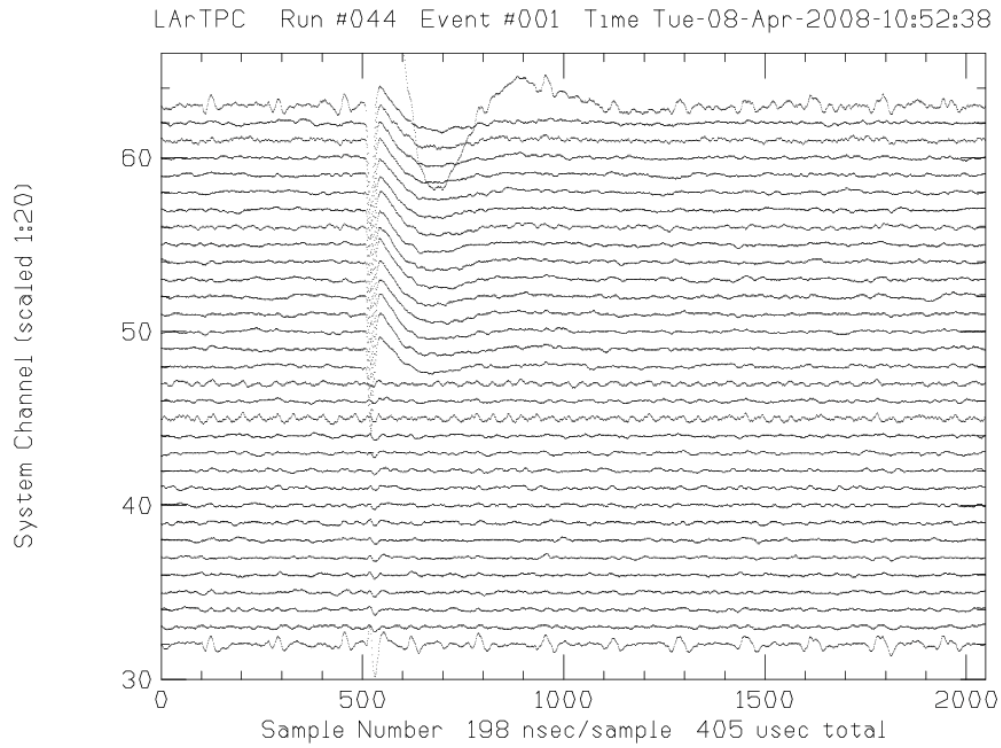

Pulser set for wires A 0-24: note signals are on channels 0-15: (wires A0-24)

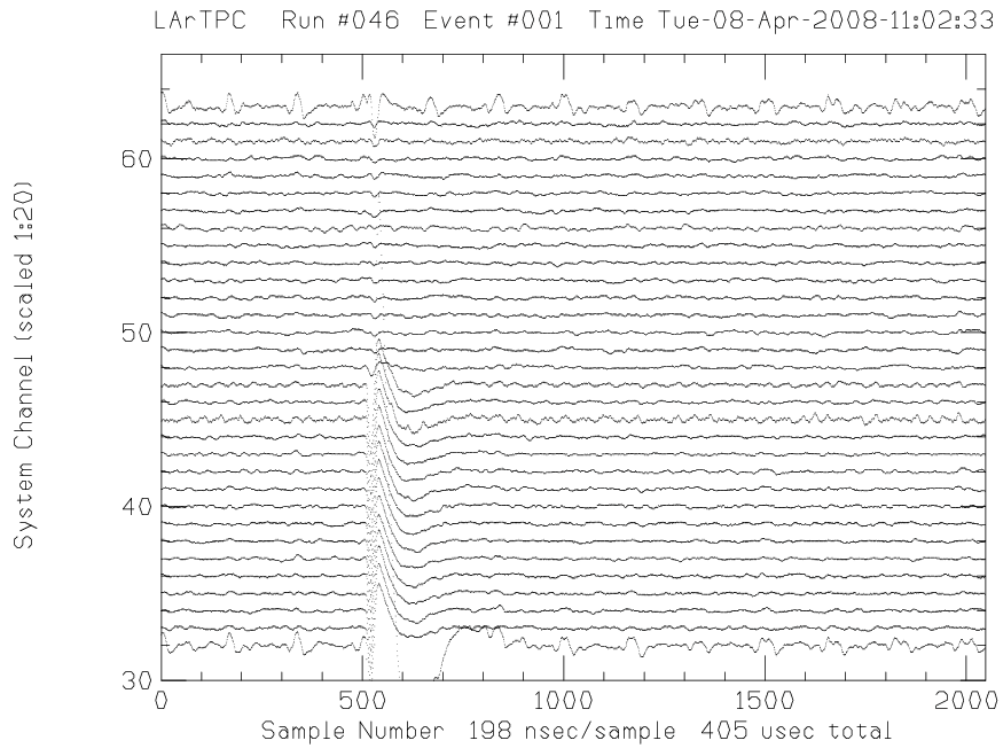

Pulser set for wires A25-49: note signals are on channels 16-31 (wires A25-49)

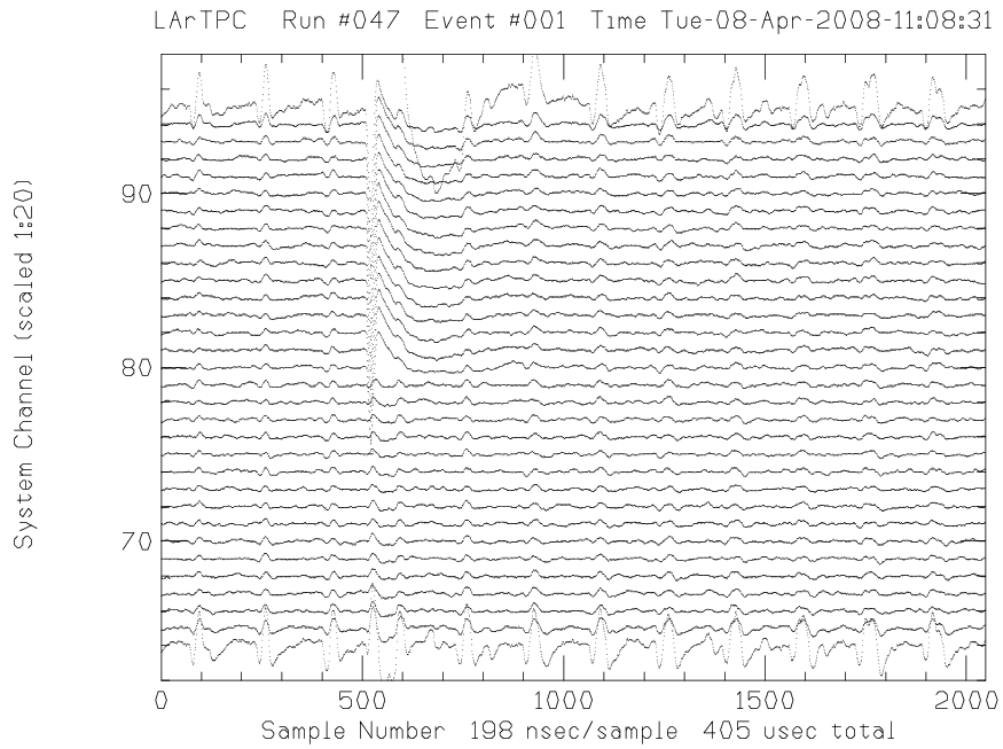

Pulser set for wires B0-24: note signals are on channels 48-63: (wires B25-49)

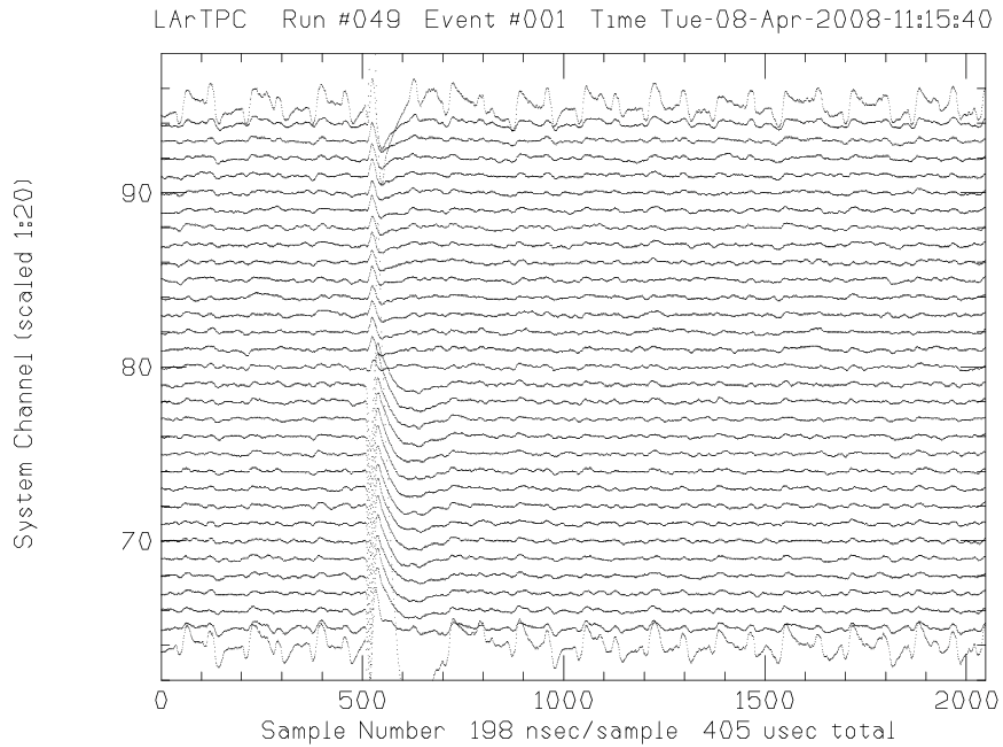

Pulser set for wires B25-49 (note signals are on channels 32-47: (wires B0-24)

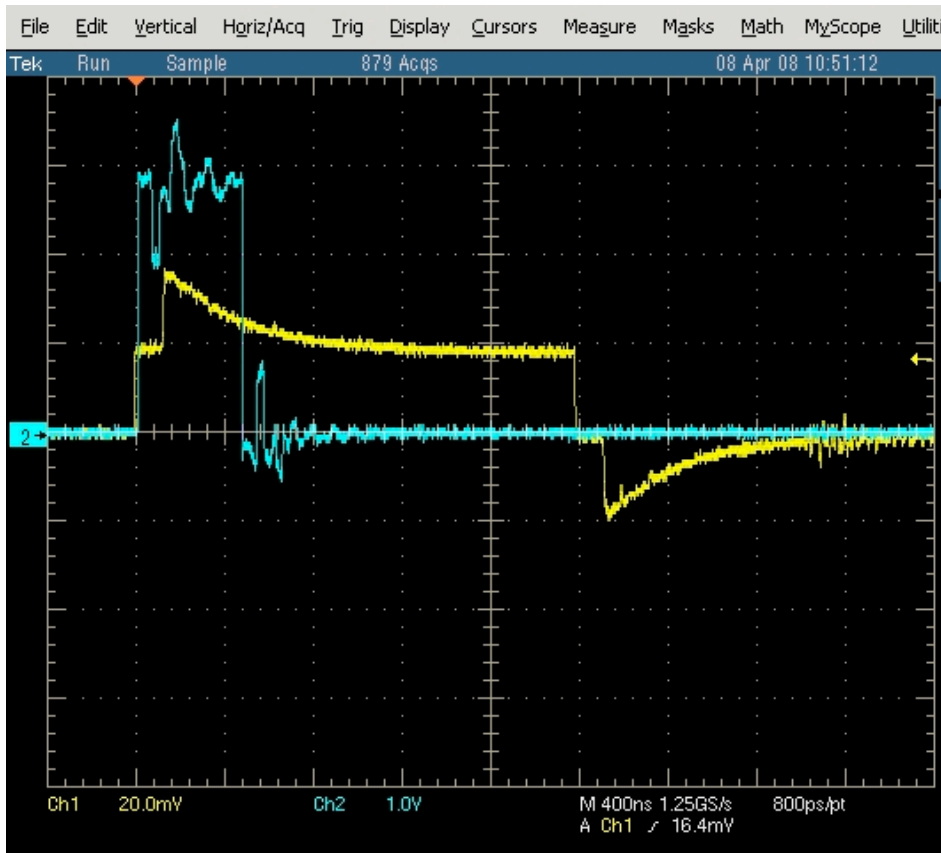

Pulser set for wires C0-24:note signals are on channels 80-95: ( wires C25-49)

Pulser set for wires C25-49:note signals are on channels 64-79: (wires C0-24)

The pulses on their way to the electronics – blue is trigger (TTL), yellow goes to the pulser. The vertical scales are yellow 20 mV/box, blue 1V/box. The trigger is 500 ns, the pulse is 2 microseconds.

Plane A is consistent between the pulser labeling and the signals seen.  
 Planes B & C show a swap between the pulser labeling and the signal labeling.  
 The signals on all 3 planes show the same polarity (ie they
